

## Important Facts About Natural Wood Products

Nature Explore field-tested components are made of natural materials that bring children in close contact with the beautiful patterns and colors of nature. Due to the nature of raw and untreated wood, you will notice graining, knots, checking (a natural cracking process that occurs as wood releases moisture across the annual growth rings), and in rare instances, insects. This is not a defect in the product, but a natural process that should be expected. Additionally, unfinished wood will naturally develop a beautiful silvery-gray patina over time.

**Below are some examples of what you may encounter and can expect with your order:**

### Natural Cracking and Checking

### Knots, Branches, Etc.

### Extending the Life of your Natural Wood Products

Nature Explore items such as Tree Cookies, Natural Balance Beams, Marimbas, At-Ease Benches, etc. are natural, untreated wood products that require regularly scheduled, routine maintenance in order to maintain safety and extend the life of the item. Some items will arrive with an initial coat of sealant while others are left untreated (please refer to product overview & specifications). It is our recommendation that you apply an initial sealant and maintain a schedule of reapplication annually to biannually to extend the life of your product. When considering treatment options we advise seeking the expertise of local wood workers, lumber yards, general contractors, etc. to understand which options are most effective and safe for your area. Routine sanding of the tops, sides and interior (if applicable) surfaces of the item will minimize splinters, reduce the chance of mildew and extend the life of your product. As your natural wood product becomes acclimated to your local environment, and sometimes even occurring in the transit process, a mildew discoloration will appear. You can reduce the risk of continued mildewing by making sure your item is installed on a surface with adequate drainage such as mulch or gravel. Installing or placement directly on grass surfaces is not recommended as it allows moisture to be trapped underneath.
